I

AB Novel multiblock copolymers containing perfluorinated poly(arylene ether) as a hydrophobic segment and disulfonated poly(arylene ether sulfone) as a hydrophilic segment are provided. A multiblock copolymer (I) is disclosed, where M<sup>+</sup> is a pos. charged counterion selected from the group consisting of K,

10/566,218

Na, and alkyl amine,  $m = 2-50$ ,  $n = 2-30$ , and  $b$  represents connection of resp. blocks. The multiblock copolymers are used to form proton exchange membranes that are thermally and hydrolytically stable, flexible, and that exhibit low methanol permeability and high proton conductivity. The proton exchange membranes are thus well-suited for use as polymer electrolytes in fuel cells.

ED Entered STN: 03 Jun 2005

AB The invention provides proton conductive polyether-polyketone-type polymers comprising (1) a plurality of first oligomers, (2) a plurality of second oligomers, (3) ion conductive monomers and (4) linking monomers. The oligomers preferably are hydrophobic and together with the proton conductive monomers are randomly dispersed between the linking monomers. Uses of such polymeric materials include the formation of polymer electrolyte membranes (PEMs), catalyst coated membranes (CCM's) and membrane electrolyte assemblies (MEA's) which may be used in fuel cells and the like. A typical block copolymer was manufactured by heating DMSO-PhMe mixture containing 4,4'-difluoro-3,3'-bis(sodiosulfo)benzophenone 17.6, 42.05:34.91 9,9-bis(4-hydroxyphenyl)fluorene-4,4'-difluorobenzophenone (I) copolymer (d.p. 4) 15.16, 34.91:40.35 I-bisphenol AF copolymer (d.p. 4) 4.10, 4,4'-biphenol 9.31, and KCO3 8.29 g 6 h at 140° and 4 h at 173-175°.

IT 852455-01-7P,  
2,2'-Biphenol-9,9-bis(4-hydroxyphenyl)fluorene-2,6-difluorobenzonitrile-4,4'-difluorobenzophenone-4,4'-difluoro-3,3'-bis(sodiosulfo)benzophenone block copolymer

AB The compns. contain polybenzimidazoles having structural units I (m1 = 1-4; R1 = imidazole ring-forming tetravalent aromatic bonding unit; R2 = divalent

aromatic bonding unit; Z = sulfonic acid residue, phosphonic acid residue) and poly(arylene ethers) having structural units of  $C_6H_3(SO_3X)-p-YC_6H_3(SO_3X)-p-OArO$  (both  $SO_3X$  are in m-position to Y; Ar = divalent aromatic; Y =  $SO_2$ , CO; X = H, monovalent cation) and  $C_6H_3(o-CN)OAr'O$  (Ar' = divalent aromatic). Ion-conductive membranes containing the compns., their composites with electrodes, fuel cells using the composites and preferably a MeOH fuel, water electrolysis apparatus using the composites, adhesives containing the compns., and manufacture of the ion-conductive membranes by casting step and drying step are also claimed. Thus, a solution containing 2,5-dicarboxybenzenesulfonic acid monosodium salt-3,3',4,4'-tetraaminodiphenylsulfone copolymer and 4,4'-biphenol-2,6-dichlorobenzonitrile-3,3'-disulfo-4,4'-dichlorodiphenylsulfone disodium salt copolymer was cast to give a film, which was processed to give a membrane showing ion conductivity 0.034 S/cm and MeOH permeability 2.97 mmol/m<sup>2</sup>-s.

AB The invention relates to a compound represented by the general formula I and a polyarylene polymer comprising units derived from the compound of the formula I and units derived from a sulfonated arylene compound. In the formula I, B is independently an oxygen or a sulfur atom; X is an atom or a group selected from halogen atoms other than fluorine, -OSO<sub>2</sub>CH<sub>3</sub> and -OSO<sub>2</sub>CF<sub>3</sub>; R<sub>1</sub> to R<sub>3</sub> may be the same or different and are selected from a hydrogen atom, a fluorine atom, a nitrile group and an alkyl group; n is an integer ≥ 2; and Q is a structure represented by the formula II, where A is independently a divalent atom or organic group or a direct bond; and R<sub>4</sub> to R<sub>11</sub> may be the same or different and

are selected from a hydrogen atom, a fluorine atom, an alkyl group, and an aromatic group. The sulfonated polymers of the invention have excellent resistance to hot water even if an increased amount of the sulfonic groups was introduced. The sulfonated polymers can be used as solid polyelectrolytes having high proton conductivity and excellent generating performance. Thus, 2,6-dichlorobenzonitrile (48.8 g, 284 mmol), of 2,2-bis(4-hydroxyphenyl)-1,1,1,3,3,3-hexafluoropropane (89.5 g, 266 mmol), and potassium carbonate (47.8 g, 346 mmol) were stirred and refluxed at 150° for 3 h in sulfolane (346) and toluene (173 mL) under nitrogen with removal of water, followed by removing toluene, slowly raising the temperature to 200°, stirring for 3 h, adding 2,6-dichlorobenzonitrile (9.2 g, 53 mmol), and reacting for 5 h. The filtered, methanol-precipitated and dried polymer (109 g) had a number-average mol. weight of 9,500. A sulfonated polymer (122 g, Mw 135,000) was obtained by reacting the above polymer (Mn 9,500, 48.7 g, 5.1 mmol) and neopentyl 3-(2,5-dichlorobenzoyl)benzenesulfonate (135.2 g, 337 mmol) under nitrogen in the presence of bis(triphenylphosphine)nickel dichloride (6.71 g, 10.3 mmol), sodium iodide (1.54 g, 10.3 mmol), triphenylphosphine (35.9 g, 137 mmol), and zinc (53.7 g, 821 mmol) in N,N-dimethylacetamide (430 mL) at 80° for 3 h, followed by deprotection of the sulfonic acid groups.

AB The composite membranes comprise polymer membranes, preferably polybenzazole (e.g., polybenzoxazole) membranes, having pores filled with ion exchange resins, where thickness of the porous polymer membranes before filling is 10-60% that after filling. The composite membranes, manufactured by forming isotropic solns. containing 0.3-3% polybenzazoles into membranes and solidifying, show high mech. strength and good gas impermeability.

AB Disclosed is an electrolyte membrane-electrode assembly wherein a hydrocarbon-based solid polymer electrolyte membrane is sandwiched between a pair of electrodes. In this electrolyte membrane-electrode assembly, the glass transition temperature of the electrolyte membrane in a dry state is not less than 160°C and the maximum moisture content of the electrolyte membrane is 10-120%. The electrolyte membrane-electrode assembly is excellent in reliability and durability.

AB The polysulfones, including structural repeating units I (X = H, monovalent cation; Y = O, S; Ar1 = arylene), are manufactured by polymerization of compns. containing II (X = H, monovalent cation; Z = halo, NO<sub>2</sub>). The polysulfones show high ionic conductivity and low fuel permeability, especially MeOH permeability, resulting in useful for direct methanol fuel cells.

AB Title block copolymers comprise repeating unit blocks I and II, wherein X1, X2, X3, X4, X5 = H or protonic acid group (at least one of them is a protonic acid group); A1, A2, A3, A4 = direct bond, CH2, C(CH3)2, C(CF3)2, O, SO2, or CO; or g, h, i, j, k, l = 0 or 1; hydrogen of the aromatic ring = H, CmH2m+1, Cl, F, CF3, or CN; and m = 1-10 integer. Thus, 42.23 g 3,3'-carbonylbis(sodium 6-fluorobenzenesulfonate) and 25.63 g bis(3-methyl-4-

hydroxyphenyl)methane were reacted at 141° for 8 h to give a copolymer with reduced viscosity 0.13 dL/g and glass transition temperature  $\geq 250^\circ$ , 21.82 g 4,4'-difluorobenzophenone and 25.63 g bis(3-methyl-4-hydroxyphenyl)methane were added therein and reacted at 157° for 8 h to give a block copolymer with reduced viscosity 1.21 dL/g and glass transition temperature 220°, 4 g of the resulting block copolymer was dissolved in 36 g DMSO/dimethylacetamide mixture, cast onto a glass substrate, dried at 200°, washed, and proton-exchanged with sulfuric acid to give a proton conductive film with ion exchange capacity 510 g/mol, moisture absorption 12%, ion conductivity 0.14 S/cm, and methanol permeability 0.4  $\mu\text{mol}/\text{cm}^2\cdot\text{minute}$ .

AB The membrane has ion exchanger resin in the continuous through holes in a support membrane, where the ion exchanger resin contains an aromatic ether and/or its derivative, formed by polymerization of mixture containing monomers I (Q = -SO<sub>2</sub>- or -CO-, X = H, Li, Na, or K, Y = F, Cl, Br, or I), aromatic dihalides, and bisphenol compound and alkali metal (bi)carbonate. The ion exchange resin contain 0-1000 structural units II (Z = H, Li, Na, K, or cation derived. from aliphatic or aromatic amines; Ar<sub>1</sub> and Ar<sub>3</sub> = bivalent organic groups, Ar<sub>2</sub> = bivalent organic groups containing ≥1 arom ring having electron attracting group) and 0-1000 structural units III. The composite membrane may be used as fuel cell electrolyte.

AB The title polymers, showing good ion conductivity and heat resistance, comprise the units of I and II (Ar, Ar' = divalent aromatic group; X = H, monovalent cation; Y = SO<sub>2</sub>, CO). The polymers and their compns. containing polybenzimidazoles are useful for ion-conductive films, electrolytes, fuel cells, and adhesives. Thus, a 1:0.38:0.62 (mol) 4,4'-biphenol-3,3'-disulfo-4,4'-dichlorodiphenylsulfone disodium salt-2,6-dichlorobenzonitrile copolymer was prepared and made into a film showing 3%-weight loss temperature 380° and ion conductivity 0.14 S/cm.

ACCESSION NUMBER: 2001:213476 HCAPLUS Full-text

DOCUMENT NUMBER: 135:5920

TITLE: Synthesis and Electrochemical and Optical  
Properties of Novel Poly(aryl ether)s with  
Isolated Carbazole and p-Quaterphenyl Chromophores

AUTHOR(S): Hwang, Shiao-Wen; Chen, Yun

CORPORATE SOURCE: Department of Chemical Engineering, National Cheng  
Kung University, Tainan, Taiwan

SOURCE: Macromolecules (2001), 34(9), 2981-2986

CODEN: MAMOBX; ISSN: 0024-9297

PUBLISHER: American Chemical Society

DOCUMENT TYPE: Journal

ED Entered STN: 26 Mar 2001

AB Two poly(aryl ether)s consisting of alternate isolated chromophores, poly[oxy-  
[9-(2-ethylhexyl)carbazole-3,6-oxy]-3,3'''-dicyano-p- quaterphenyl-4,4'''-  
ylene] (PCNCA) and poly[oxy-[9-(2-ethylhexyl)carbazole-3,6-oxy]-3,3'''-  
bis(trifluoromethyl)p-quaterphenyl-4,4'''-ylene] (PCFCA), were synthesized and  
characterized. The synthesized polymers are completely soluble in common  
organic solvents such as THF and chloroform. The two poly(aryl ether)s exhibit  
good thermal stability with 5% weight loss above 400° in nitrogen. The UV/vis  
and photoluminescent spectra of the polymers show maximum peaks at around 318-  
319 and 407-413 nm in the film state, resp. The HOMO and LUMO energy levels  
of these polymers, which were measured by cyclic voltammetry, are -5.23, -3.25  
eV for PCNCA and -5.41, -3.32 eV for PCFCA. The p-quaterphenyl segments are  
regarded as electron transporting units because the electron withdrawing  
substitutes (cyano and trifluoromethyl) enhance the electron affinity. The  
carbazole segments act as hole transporting units. The two units may lower  
the barrier of charge injection from opposite electrodes. Furthermore, all of  
the two units are emissive chromophores and contribute to the  
photoluminescence. The relative quantum yield of PCNA and PCFCA is 0.02, 0.40,  
resp., in film state, and 0.04, 0.19, resp., in THF.
